

At QUICK-STEP® we take our responsibility towards the planet very seriously!

Since our establishment in 1960, circularity has been part of our DNA. In fact, reusing materials is at the very foundation of our business and, as we look to the future, we have three objectives: to reduce, reuse, and recycle.

Unilin has upheld and practised the principles of a circular economy since it began. You might say we invented the concept when we developed particle board to use up flax straw, a by-product of flax production.

When using a renewable resource, we make sure that what we are taking from the planet can be replaced and taken again in the future. We take great care in using responsibly sourced raw materials which we process in the most energy efficient ways possible.

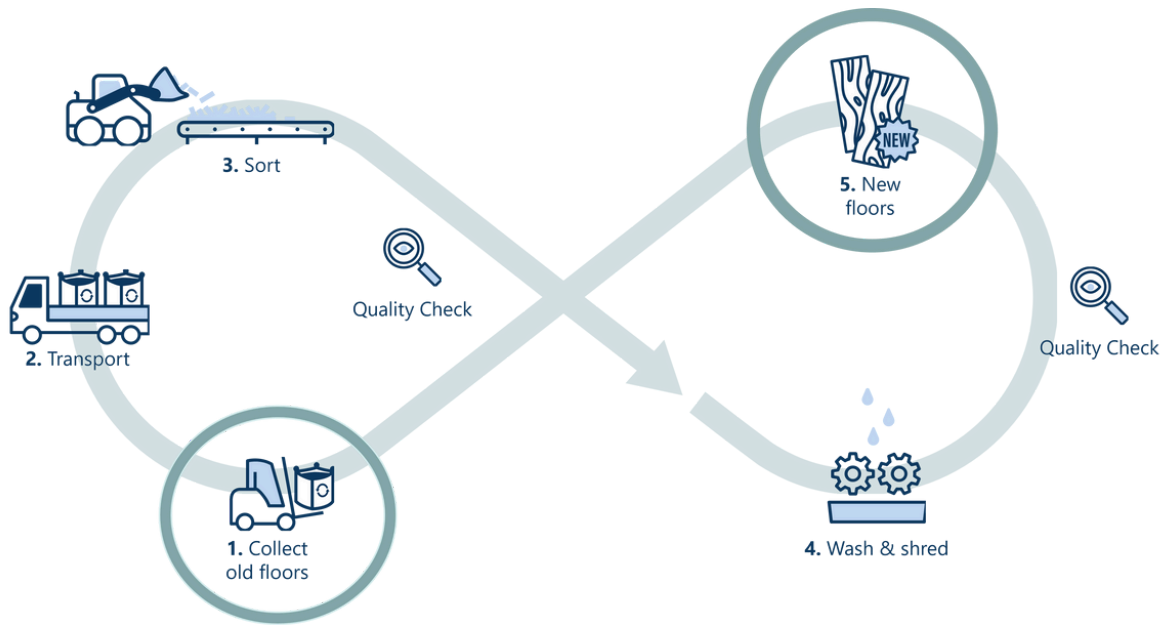

Unilin lead the world in sustainability with our laminate flooring. In 2024 we invested €20 million into the world's first MDF/HDF recycling facility at our wood panel site in Bazeille, France. Development of this unique patented technology, that enables us to break down resins using steam resulting in reusable wood fibres, has taken over 5 years.

Our competitors buy their resin binder from external parties, whereas we produce our own in order to control and monitor the right amount of substances. Doing that allows us not only to comply to the European Norm, but to challenge them by producing a resin that is using 10 times less formaldehyde than the most stringent EU-norm.

The same holds for the amount of VOC's that affect the indoor air quality. We produce laminate that releases 10 times less VOC's than the most recent EU-norms. Furthermore, our products do not contain carcinogenic, mutagenic, or reprotoxic substances.

Reduce . Reuse . Recycle

We are the world's first manufacturer to successfully recycle and reuse wood fibres from HDF & MDF. This doubles the lifespan of our wood fibres, saving >380,000 tons of CO₂.

The core of our laminate and waterproof timber range is made of 100% recovered or recycled wood; we use tree trimmings, forestry slash, and waste wood. We have a zero % landfill policy.

We use the whole tree in our timber flooring production and only source from sustainably managed forests. Recovered Hevea and fast-growing Nordic Spruce are used in our engineered timber with core mats and backing layers.

Timber lamellas are sliced to reduce waste, and superior surface coatings ensure longer wear and tear, reducing the need to replace or refinish timber floors often.

100% of non-recoverable wood waste is converted into green energy which is used in our production (saving >25,000 tons of fossil CO₂ emissions per year). Furthermore, we have nearly 82,000 solar panels and 5 wind turbines powering our production.

We were the first flooring producer in the world to receive the Ecolabel. Since then we have acquired many more certifications, holding ourselves to the highest standards.
